

Playmaker Picks

Official play recording and results guide

Automatic image flow

1. Upload a betting-slip image in the configured image channel. 2. The bot reads the selections, odds, and units. 3. The bot posts User Reviewing Bet with a Review image button. 4. Review and confirm. 5. The bot posts an editable play card with the slip image, play number, units, odds, potential win, and selections. Results update on that card.

Manual play entry

Use `/play` when there is no image. Enter units, number of legs, Leg 1 selection, Leg 1 odds, and the optional team. Additional legs are entered one at a time. Each leg and its odds are stored, then combined when the final leg is submitted.

Testing without recording

Configure `TEST_CHANNEL_ID`, then use the protected command `/testing enabled:true`. Upload an image in the test channel. The bot parses the image and shows the result without writing to the database, posting a bet, or requiring confirmation. Use `Enter units` if the caption/image does not show units, then `Complete test`. Disable testing with `/testing enabled:false`. Only configured operators or server managers can change the runtime toggle; a restart restores the default state.

Editing a recorded bet

The confirmation channel receives a brief `Bet recorded: Play #...` message with an `Edit bet` button. Only the original user can edit it. The edit form loads each leg from the database, accepts one selection and one odds value per line, recalculates combined odds, and updates the stored play.

Results and reactions

The original user can react to the recorded play post: ☐ Win, ☐ Loss, ☐ Void, or ☐ Partial. Win, loss, and void settle immediately, and the result appears on the play card without a direct message. Use `/settle` for partial results.

Tracker updates

The Unit Summary and Top Playmakers embeds refresh automatically at the top of each hour (Eastern Time), editing the existing posts. Use `/update_tracker` from any channel to refresh them immediately.

If something does not appear

Check that the bot is online, the user has the required official role, the image channel is configured, and the bot has permission to read messages, send messages, manage messages, and send direct messages. For deployment updates, pull the latest code and restart the `systemd` service.

Quick configuration keys: `IMAGE_INPUT_CHANNEL_ID` • `TEST_CHANNEL_ID` • `TESTING` • `TRACKING_CHANNEL_ID` • `RESULT_CHANNEL_ID` • `TEAM_STATS_CHANNEL_ID`
