

Playmaker Picks

Command reference and results guide

Recording a play from an image

Post your betting-slip image in the official plays channel. No command is needed. The bot reads the selections, odds, and units, then shows you a private preview. Press Confirm and record to record the play. If the slip does not show your units, press Enter units first, then confirm. Your original image post is the message that gets tracked, so react on that post to settle the play. The confirmation card, with the Edit bet button, is sent to the confirmation channel.

Recording a play manually

Use /play when you have no image. You need an official role and must run it in the official plays channel. Enter your units, the number of legs, the Leg 1 selection, the Leg 1 odds, and an optional team. Multi-leg plays prompt for each remaining leg one at a time, and the combined odds are calculated automatically when the final leg is submitted. The bot posts a bet embed to the official plays channel, and that embed is what you react to.

Settling a play with reactions

React directly on the tracked message in the official plays channel. The play owner and anyone holding an operator role can settle. Reactions posted in any other channel are ignored.

Icon	Result	What happens
	Win	Settles immediately and updates the card
	Loss	Settles immediately and updates the card
	Void	No change to your unit total
	Partial	Not processed by reaction — use /settle instead

Commands for everyone

Command	What it does
/update_tracker	Refreshes the Unit Summary now and catches up any missed reactions. The tracker also refreshes automatically every hour, Eastern Time.
/rankings	Posts the current team ranking summary.
/summary	Posts the daily playmaker report with the top three finishers.
/tracker_start date_value:show	Shows the date the tracker is currently counting from.
/test	Runs system diagnostics. Attach an image to parse it without recording anything.

Commands for officials

Command	What it does
/settle play_id: result:	Settles a play. Accepts win, loss, void, partial, or regraded. Use this for partials and for any play whose message was deleted. The play ID is the number shown on the card as "Play #43".
/regrade play_id: legs_left: odds: [note:]	Use when a leg voids and the rest of the parlay stands. Sets the remaining leg count and the new odds. Regraded plays count as zero units.

Commands for operators and server managers

Command	What it does
/tracker_start date_value:YYYY-MM-DD	Counts only plays settled on or after this date, for example 2026-09-28. Everything earlier is hidden from the tracker but is never deleted.
/tracker_start date_value:clear	Counts every play again.
/testing enabled:true	Sends parsed plays to the test channel without writing to the database.
/testing enabled:false	Returns to normal recording.

Both settings revert to their .env defaults when the bot restarts. Set TRACKER_START_DATE or TESTING in .env to make a change permanent.

How units are scored

Wins pay the true price of the bet. Risking 2 units at +250 and winning returns +5 units; the same 2 units at –110 returns +1.82 units. A loss always costs the full amount risked. Voids and regrades count as zero. Your record displays as wins-losses, and the net unit figure reflects actual profit rather than a flat win count.

If something does not appear

Check that the bot is online, that you hold the required official role, and that you are posting in the correct channel. Plays only record from the official plays channel, and only reactions in that channel settle a play. If a result will not settle by reaction, ask an official to run /settle. After a deployment, pull the latest code and restart the service.
